

Module 1: Introduction & Setup

Assignment 1.3 – Project Structure Understanding

Objective:

Understand Angular project structure.

Tasks:

Explain the purpose of each file in **2–3 lines**:

Example Files

Angular Project Structure Explanation (student-app)

.vscode/

- Contains VS Code editor settings for the project.
 - Helps maintain consistent formatting and debugging configuration.
-

node_modules/

- Stores all installed npm packages and Angular dependencies.
 - This folder is auto-generated and should not be edited manually.
-

public/

- Contains static files like images or icons.
 - These files are copied directly to the build output.
-

src/

- Main source folder of the Angular application.
- All application code (components, styles, HTML) lives here.

src/app/ (Application Logic)

app.ts (App Component)

- This is the **root component** of the application.
- It contains component logic, variables (like `title`), and methods.

app.html

- This file contains the **HTML template** for `app.ts`.
- It defines what is displayed on the browser screen.

app.css

- Contains CSS styles specific to the App component.
- Used to style elements defined in `app.html`.

app.routes.ts

- Defines application **routes and navigation paths**.
- Used for page navigation in Angular apps.

app.config.ts

- Holds application-level configuration.
 - Used in standalone Angular apps instead of `app.module.ts`.
-

app.spec.ts

- Used for **unit testing** the App component.
 - Helps ensure the component works correctly.
-

src/ (Other Important Files)

main.ts

- Entry point of the Angular application.
 - Bootstraps (starts) the root component.
-

index.html

- Main HTML file loaded in the browser.
 - Angular renders the app inside `<app-root>` here.
-

styles.css

- Global stylesheet for the entire application.
 - Styles written here apply to all components.
-

Root Configuration Files

angular.json

- Configuration file for Angular CLI.
 - Controls build, serve, and project settings.
-

package.json

- Lists project dependencies and npm scripts.
 - Used to install and manage libraries.
-

package-lock.json

- Locks exact dependency versions.
 - Ensures consistent installs across systems.
-

tsconfig.app.json

- TypeScript configuration for the application code.
 - Controls how TypeScript is compiled.
-

tsconfig.spec.json

- TypeScript configuration for test files.
 - Used when running unit tests.
-

.gitignore

- Specifies files and folders Git should ignore.
 - Prevents unnecessary files from being committed.
-

.editorconfig

- Maintains consistent coding styles across editors.
- Controls indentation and formatting rules.

README.md

- Documentation file describing the project.
- Usually contains setup and run instructions.

Short Summary (One Line)

Angular projects are divided into **components (logic + UI)**, **configuration files**, and **dependency management files**.
